LECTURE 2: RECURRENCES

Asymptotic notation

“Big Oh” notation: $f(n) = O(g(n))$ is an abbreviation for:

“There exists positive constants c and n_0 such that $0 \leq f(n) \leq c g(n)$ for all $n \geq n_0$ ”.

In this case we say that $g(n)$ is an asymptotic upper bound for $f(n)$.

$f(n) = O(g(n))$ means that $f(n)$ does not grow substantially faster than $g(n)$ because a multiple of $g(n)$ eventually dominates $f(n)$.

Clearly, multiplying constants c of interest will be larger than 1, thus “enlarging” $g(n)$.

Asymptotic notation

“Omega” notation: $f(n) = \Omega(g(n))$ is an abbreviation for:

“There exists positive constants c and n_0 such that $0 \leq c g(n) \leq f(n)$ for all $n \geq n_0$.”

In this case we say that $g(n)$ is an asymptotic lower bound for $f(n)$.

$f(n) = \Omega(g(n))$ essentially says that $f(n)$ grows at least as fast as $g(n)$, because $f(n)$ eventually dominates a multiple of $g(n)$.

Clearly, multiplying constants c of interest will be smaller than 1, thus “shrinking” $g(n)$ by a constant factor.

“Theta” notation: $f(n) = \Theta(g(n))$ iff and only if $f(n) = O(g(n))$ and $f(n) = \Omega(g(n))$; thus, $f(n)$ and $g(n)$ have the same asymptotic growth rate.

Since Merge(A, p, q, r) runs in linear time, the runtime $T(n)$ of Merge-Sort(A, p, r) satisfies

$$T(n) = 2T\left(\frac{n}{2}\right) + cn$$

Thus,

$$\sum_{i=0}^{\lfloor \log_b n \rfloor - 1} a^i f\left(\frac{n}{b^i}\right) = \Theta\left(n^{\log_b a} \log_b n\right) = \Theta\left(n^{\log_b a} \log_2 n\right)$$

because $\log_b n = \log_2 n \cdot \log_b 2 = \Theta(\log_2 n)$. Since we had (1):

Master Theorem Proof: Homework

Exercise 1: Show that condition

$$f(n) = \Omega(n^{\log_b a + \varepsilon})$$

follows from the condition

$$a f(n/b) \leq c f(n) \text{ for some } 0 < c < 1.$$

Exercise 2: Estimate $T(n)$ for

$$T(n) = 2T(n/2) + n \log n$$

Note: we have seen that the Master Theorem does NOT apply, but the technique used in its proof still works!
